Motivation about becoming a web developer

About six months ago a friend of mine suggested to try out taking an online course in web development. I always had this spark in me about writing the code, so gave it a shot. I started with HTML and CSS, because I found lots of articles on the internet, recommending to start from what you can understand more easily. I was happy with the outcoming results, so I decided to continue my career in an IT field as a web developer. I am eager to take a deeper look how the web development process is done in real life situations. I am highly motivated in further improvement, and I'm open to new challenges.
